Condominium Oversupply Challenges in Metro Manila

FINAL REQUIREMENT

ISSUE

Metro Manila faces a surge of condominium supply as reported in BusinessWorld's *"The Truth Behind Metro Manila's Condo Crisis" (2024)* and the YouTube documentary *"Understanding the Condo Oversupply in Metro Manila"*. Real estate developers and firms continue to construct new condominium buildings even with low demand. This results in high vacancy rates and falling rental yields. The main challenge is how to effectively balance the supply and demand. They need to optimize pricing strategies, identify unit types with highest risk of stagnation, and plan inventory turnover. Without strategic planning and action, developers and firms could face risk in lower profits. Investors could also face reduced returns from slow sales and depreciating unit values.

ANALYTICS

Clustering analysis and Regression modeling can be used to address this issue. Clustering Analysis groups condominiums by location, price per square meter, floor area, and buyer demographics. This creates categories such as affordable high-demand, luxury oversupplied, or mid-range steady. The next method is Regression Analysis. It measures the relationship between market variables like unit prices, vacancy rates, and economic factors like inflation or interest rates. It also forecasts sales and rental trends. Combining these methods helps developers predict which projects are resilient and which need adjustments in discounts, rental rates, or project timelines.

INDUSTRY PRACTICE

Integrating the analytics into decision making can give developers and firms a data-driven approach instead of intuition or static reports. These methods enhance strategic planning by identifying profitable markets segments, maximizing pricing models, and reducing financial risks. Applying analytics also aligns with global real estate industry practices. They also use these strategies to develop data-driven forecasting, clustering, and prescriptive modeling guidelines.
